

AMENDMENTS TO THE CLAIMS

The listing of claims below replaces all prior versions of claims in this application.

1. (Cancelled)

2. (Previously Presented) A manipulator with multiple degrees of freedom for surgery driven by a driving means, comprising:

a pair of gripping members;

a first axis that connects both the gripping members rotatably;

a second axis existing on an imaginary plane substantially perpendicular to the first axis;

a first link mechanism for converting a drive power of the driving means to a rotary motion of one gripping member around the first axis;

a second link mechanism for converting a drive power of the drive means to a rotary motion of the other gripping member around the first axis; and

a third link mechanism for converting a drive power of the driving means to a rotary motion of both the gripping members around the second axis[.];

a first supporting body for supporting the gripping members with the first axis; and

a second supporting body for supporting the first supporting body with the second axis,

wherein each of the first and second link mechanisms comprises: a first link supported slidably by the first supporting body, a second link supported slidably by the second supporting body; and a third link for connecting between the first link and the second link, and

wherein each of the link mechanisms is a mechanism in which a plurality of rigid links are connected in ~~pair~~ pairs.

3. (Cancelled)

4. (Cancelled)

5. (Currently Amended) A manipulator with multiple degrees of freedom according to ~~claim 4~~ claim 2 wherein an axial line of the second axis and the third link are perpendicular to each other when the first link, the second link and the third link are arranged in line.

6. (Original) A manipulator with multiple degrees of freedom according to claim 5 wherein a rotation range of the gripping member is predetermined and when the first link, the second link and the third link slide with a state in which they are arranged in line, the axial line of the second axis and the third link are always perpendicular to each other in the rotation range.

7. (Currently Amended) A manipulator with multiple degrees of freedom according to any one of ~~claims 3 to 6~~ claims 2, 5 and 6, wherein the third link mechanism comprises:

a fourth link supported slidably by the second supporting body;

a fifth link that is fixed to the first supporting body and rotatable around the second axis;

and

Application No.: 10/582,885
Art Unit: 3734

Amendment under 37 C.F.R. §1.116
Attorney Docket No.: 062670

a sixth link for connecting between the fourth link and the fifth link.
